

Button-and-loop fasteners from the River Ljubljana

At first glance, this is easy project but it actually turned out to be a challenge for me! It turned out to be difficult to achieve a resemblance to this subject. The ancient master achieve this result by doing everything in one fell swoop being guided only by his own desire.

All leaves are different in shape and size. The rosettes tilt are very specific and are made with a tool that is designed for this model. The imitation is very difficult and I have made this wax model in accordance with my creative view.

All leaves are cut and glued separately on the rosette base on wax.

How to hang a gladii sword on a belt! It doesn't matter what model the hangers are - simple concentric circles , floral decorations or with images of emperors.

Finished and ready for installation. The scientific publication clearly states that the Ljubljana hangers are partially gilded.

They are products of the Augustan period and originate in Italian territory. Because of the high artistic value and the prestigious character of this set, it seems likely that it had belonged to a Roman officer.

This hanger is important to me because it is related to my creative project Cingulum plate from River Ljubljana , from National Museum of Slovenia .Both objects are united by the historical period of origin the beginning of the 1st century period and the fact that they are from River Ljubljana (now on display National Museum of Slovenia).

The mounting method for both :the pugio and for gladii are described in detail and illustrated in the publication: ROMAN MILITARY EQUIPMENT FROM THE RIVER LJUBLJANICA .

ROMAN MILITARY EQUIPMENT FROM THE RIVER LJUBLJANICA Typology, Chronology and Technology

Research using the method of PIXE for the characterisation of non-ferrous metals in Roman military equipment from the River Ljubljana (SI)

ROMAN MILITARY EQUIPMENT FROM THE RIVER LJUBLJANICA

11.3 Gilded silver button
and loop fastener with relief
decoration (H3)

The H3 round fastener with a double loop is of high quality silver alloy and gilded on the front (Pl. 19; Fig. H3).⁴⁶³

It is chased with tiny dots, like the gilded silver locket of the MM A24 sword scabbard (Figs. 22a, c, e, 25) and the H1 silver belt-plate, that probably form part of a set from the Middle to Late Augustan period.⁴⁶⁴ Other artefacts boasting lavish relief decoration on a background chased with tiny dots are a pair of silver and partially gilded disc brooches from Trier, already discussed in Chapter 11.1.⁴⁶⁵

The general decorative scheme on the H3 fastener is similar to that of the silver disc brooch (diameter 27 mm) from Lahnau-Waldgirmes, mentioned in Chapter 11.1 and probably dating to the end of the Middle Augustan period.⁴⁶⁶ Its upper side bears a very fine relief depiction of a pair of rosettes, one outer and one inner, with the addition of coloured glass inlays (red glass in the rivet head at the centre of the brooch and dark blue and green glass on the leaves of the outer rosette) and gilding of select parts of the surface.

The double loop of the H3 fastener points to a pre-Flavian date.⁴⁶⁷

The function of H3 can be inferred from that of two similar fasteners with a double loop from Vindonissa (Windisch, Switzerland) and Ilok (Croatia), respectively.

Their archaeological contexts reveal a close connection with the military belt and the Mainz type sword scabbard.

Silver with **gilding**. dia. 40 mm, height 21 mm, deb. tiles on the edge 0.7 mm, deb. loops 2.3 mm, weight 14 g. And in. no. V 449.

Ljubljana near Bevka (Krajna) .1093

Underwater topography, dive 1984; NMS acquired 1984.

Istenič 2009, cat. 74.

The loop is massive compared to the tile. It is not clear either the object was made in one piece or they were

tile and bracket made separately and was bracket
from the bottom through the middle of the tile embedded in a massive
a semicircular head on the top of the tile.
Insert the part of the bracket into the plate and the semicircular head
not visible on X-ray. Semicircular head
has in the middle of the upper side approx. millimeter wide and
the same deep hole.
