Phalerae with concentric circles models.

Concentric circles phalerae models is very often found on Roman statues and stelae as a decoration of various military equipment (in different sizes). Including and widespread on the as breastplates phalerae. The variety of published archeology as models, sizes and material used is so great that I will not be able to dwell on such details in my publication. The early images have their own specific cross section, features and differ from the later variations of the masters. The material used for this model is mainly bronze. But there are also scientific publications on many silver ones. Coating with precious metals on copper or bronze phalerae are also widely used. Most of these phalerae were made in antiquity separately and were attached to various straps then fastened with buckles on armor. Others were hammered or engraved directly on the armor, or on the major parts. The preserved disks models images from antiquity such as reliefs from statues, stelae and reliefs also bring us rich information. These archeological monuments are mostly made of marble ,but and other stones as a material were used in the Roman Limes to perpetuate legionnaires and officers.

……

These are some of our creative projects on this subject as a result of our inspiration from the published material in scientific articles. Of course, everything is refracted through your creative gaze!

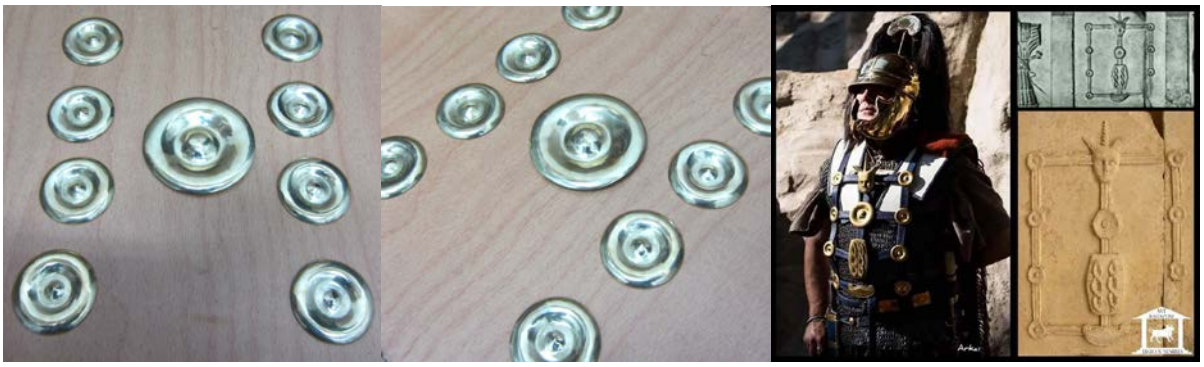

Ready for mounting on the leather straps. My model of concentric disks phalerae are with diameter 60 mm. in diameter.
